# Systematic design of advanced control structures

Adriana Reyes-Lúa

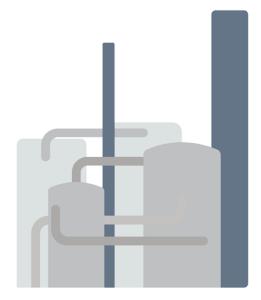

February 28<sup>th</sup>, 2020

NTNU

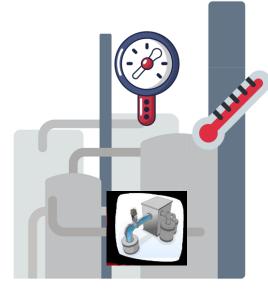

## Content

- Motivation and scope
- Active constraint switching with advanced control structures (chapter 2)
  - Case study: mixing
  - Case study: distillation column
  - Case study: cooling cycle (chapter 3)
  - Case study: cooler (chapter 4)
- MV to MV constraint switching
  - Split range control
    - Design of standard split range controllers (chapter 5)
    - Generalized split range controller (chapter 6)
  - Multiple controllers with different setpoints (chapter 7)
- Improved PI control for tank level (chapter 8)
- Conclusions

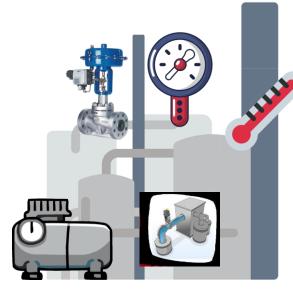

# CV: controlled variable (output, *y*)

- Temperature
- Pressure
- Concentration

# CV: controlled variable (output, *y*)

- Temperature
- Pressure
- Concentration

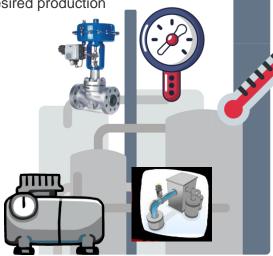

# MV: manipulated variable (input, *u*)

- Valve opening
- Compressor rotational speed

#### DV: disturbance variable (d)

- Ambient temperature
- Raw materials
- Desired production

# CV: controlled variable (output, *y*)

- Temperature
- Pressure
- Concentration

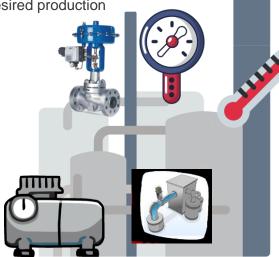

# MV: manipulated variable (input, *u*)

- Valve opening
- Compressor rotational speed

#### DV: disturbance variable (d)

- Ambient temperature
- Raw materials ٠
- Desired production

#### **CV: controlled** variable (output, y)

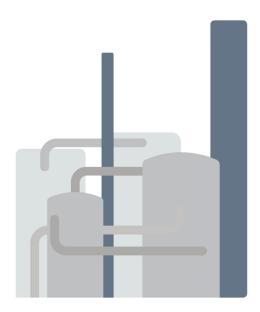

- Temperature •
- Pressure •
- Concentration

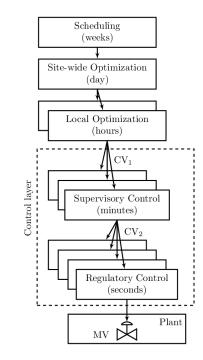

#### **MV:** manipulated variable (input, u)

- Valve opening •
- Compressor rotational ۰ speed

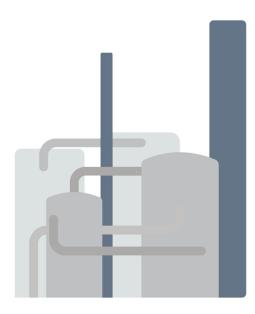

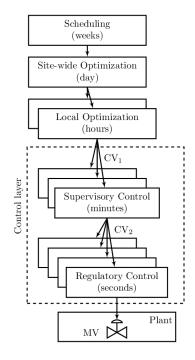

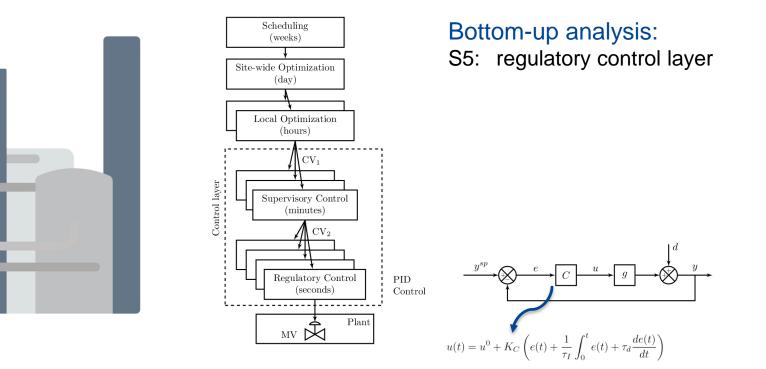

#### Top-down analysis:

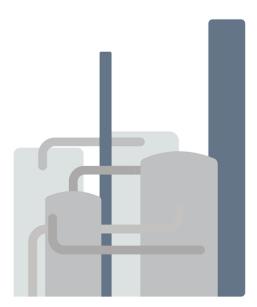

S1-S4: Identify steady-state optimal operation

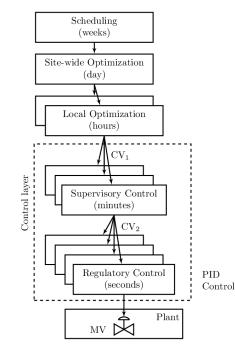

Bottom-up analysis: S5-S7: Design control structure

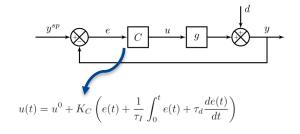

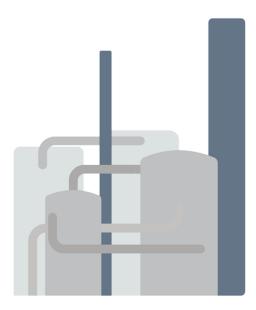

#### Bottom-up analysis:

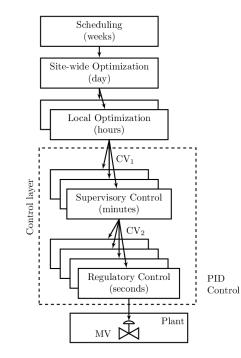

S5: regulatory control layer

- S6: supervisory control layer
- S7: online optimization layer

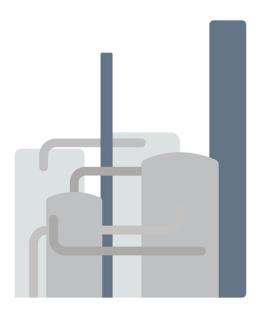

#### Bottom-up analysis:

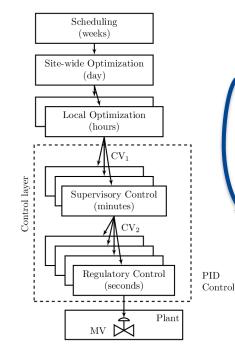

S5: regulatory control layer

S6: supervisory control layer

S7: online optimization layer

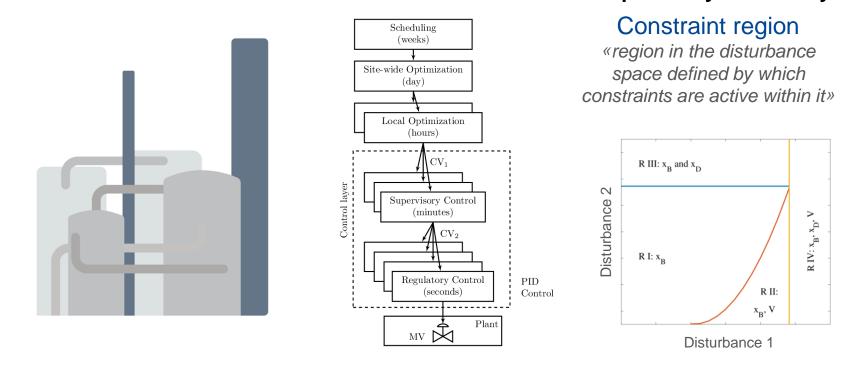

Bottom-up analysis:

S5: regulatory control layerS6: supervisory control layerS7: online optimization layer

Keeps operation in the right active constraint region

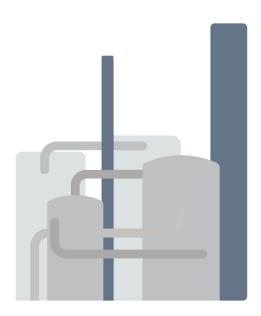

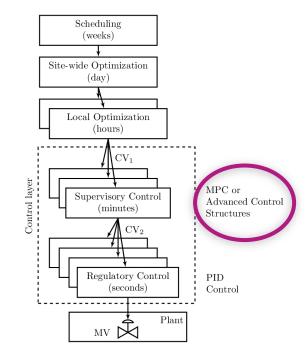

Jacobsen and Skogestad (2011) Active constraint regions for optimal operation of chemical processes. Industrial & Engineering Chemistry Research.

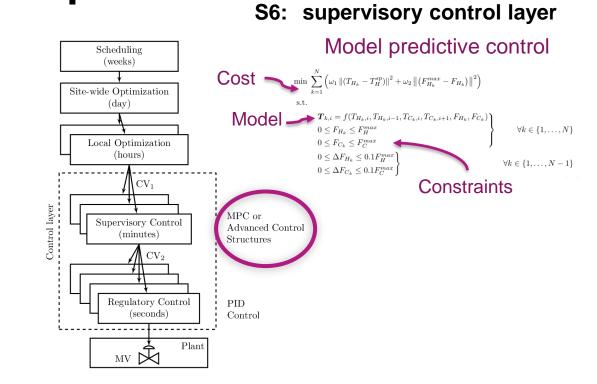

S6: supervisory control layer

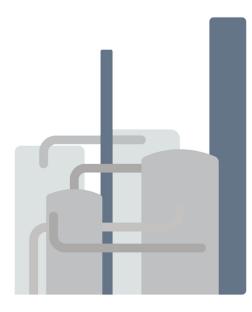

#### S6: supervisory control layer

# Design procedure for active constraint switching with classical advanced control structures

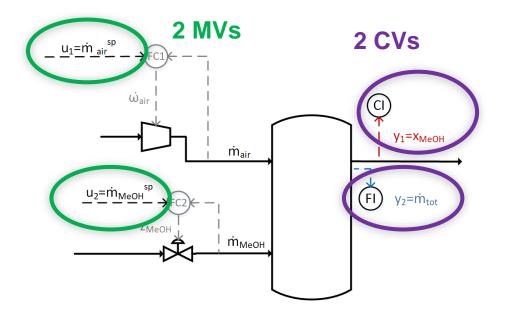

Step A1: Define control objectives, CV constraints and MV constraints

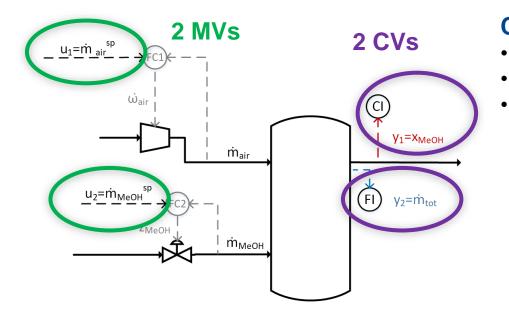

Step A1: Define control objectives, CV constraints and MV constraints

Step A1: Define control objectives, CV constraints and MV constraints

#### **Control objectives:**

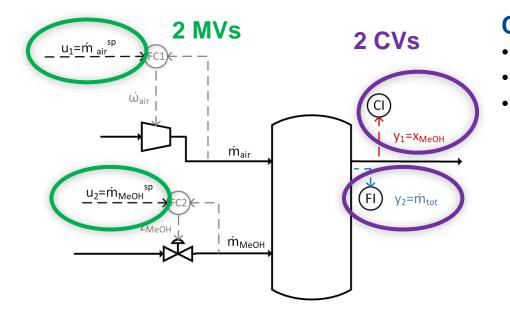

- Keep  $y_1 = x_{MeOH} = 0.10 \leftarrow ideal$
- Keep  $y_1 = x_{MeOH} > 0.08$

• Control  $y_2 = m_{tot}$ 

← ideal

Step A1: Define control objectives, CV constraints and MV constraints

#### **Control objectives:**

- Keep  $y_1 = x_{MeOH} = 0.10$
- Keep y<sub>1</sub>

$$y_1 = x_{MeOH} > 0.08$$

Control y<sub>2</sub> =

 $y_2 = m_{tot}$ 

Variable	Units	Maximum	Nominal
$y_1 = x_{MeOH}$	kmol/kmol	0.10	0.10
$y_2 = \dot{m}_{tot}$	kg/h		26860
$u_1 = \dot{m}_{air}$	$\rm kg/h$	25800	23920
$u_2 = \dot{m}_{MeOH}$	$\rm kg/h$	-	2940

#### $u_1$ is has a maximum value

Step A2: Organize constraints in priority list

#### Step A2: Organize constraints in priority list

(P1) Physical MV inequality constraints	<ul> <li>Constraint on air flow (u<sub>1</sub>)</li> <li>Constraint on MeOH flow (u<sub>2</sub>)</li> </ul>	$\dot{m}_{air}^{min} \leq \dot{m}_{air} \leq \dot{m}_{air}^{max}$ $\dot{m}_{MeOH}^{min} \leq \dot{m}_{MeOH} \leq \dot{m}_{MeOH}^{max}$
(P2) Critical CV inequality constraints	- Constraint (max and min) on $x_{\mbox{\scriptsize MeOH}}$ (y_1)	$x_{MeOH}^{min} \le x_{MeOH} \le x_{MeOH}^{max}$
(P3) Less critical CV and MV constraints	• Setpoint on $x_{MeOH}$ (y <sub>1</sub> )	$x_{MeOH} = x_{MeOH}^{sp}$
(P4) Desired throughput	<ul> <li>Setpoint on m<sub>tot</sub> (y<sub>2</sub>)</li> </ul>	$\dot{m}_{tot} = \dot{m}_{tot}^{sp}$
(P5) Self-optimizing variables	<ul> <li>No unconstrained degrees of freedom</li> </ul>	

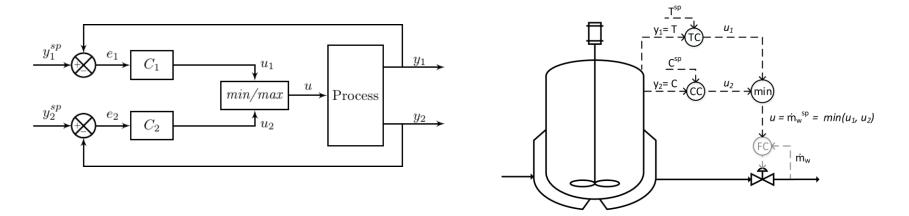

Step A3: Identify possible and relevant active constraint switches

Step A3: Identify possible and relevant active constraint switches

• Case 1: CV to CV constraint switching

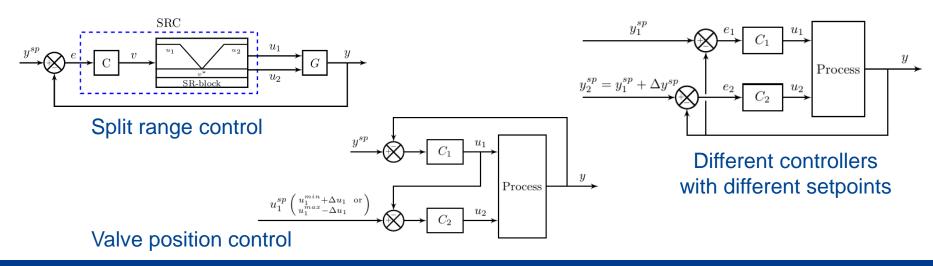

One MV switching between two alternative CVs.

Step A3: Identify possible and relevant active constraint switches

 Case 2: MV to MV constraint switching More than one MV for one CV.

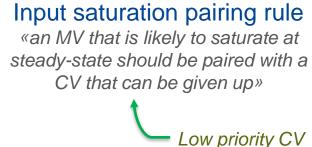

Step A3: Identify possible and relevant active constraint switches

 Case 3: MV to CV constraint switching MV controlling a CV that may saturate; no extra MVs

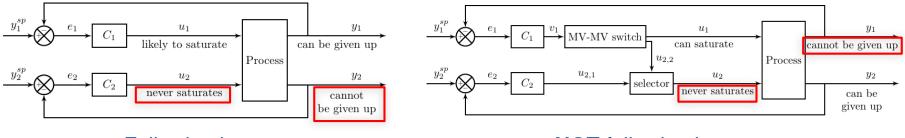

Step A3: Identify possible and relevant active constraint switches

 Case 3: MV to CV constraint switching MV controlling a CV that may saturate; no extra MVs

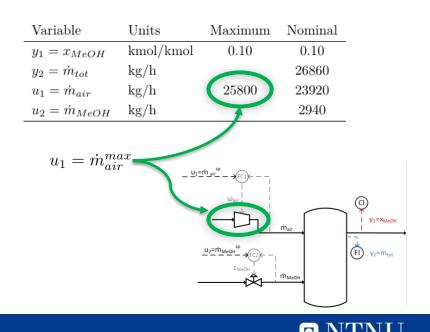

Following input saturation pairing rule

**NOT** following input saturation pairing rule

Step A3: Identify possible and relevant active constraint switches

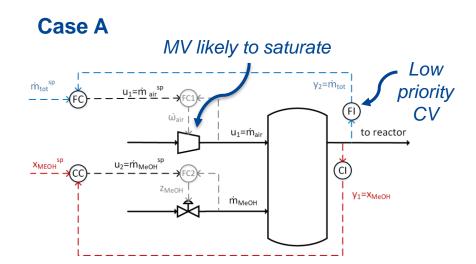

- At nominal operation point all constraints are satisfied
- Constraint switch:
  - Reach maximum air flow (u<sub>1</sub>)
  - Lose a degree of freedom (case 3)
    - Must give up controlling the constraint with the lowest priority (desired throughput)

Step A4: Design control structure for optimal operation

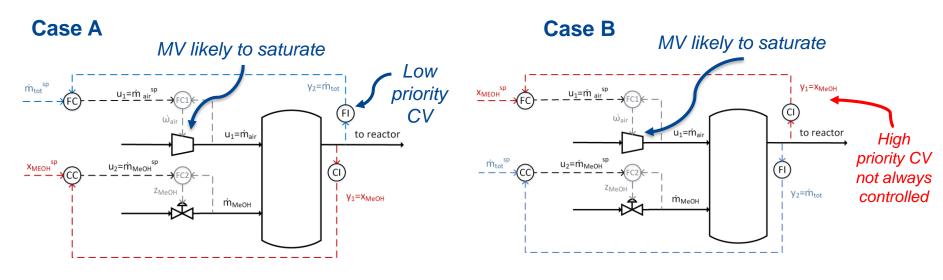

Step A4: Design control structure for optimal operation

Following input saturation pairing rule

Step A4: Design control structure for optimal operation

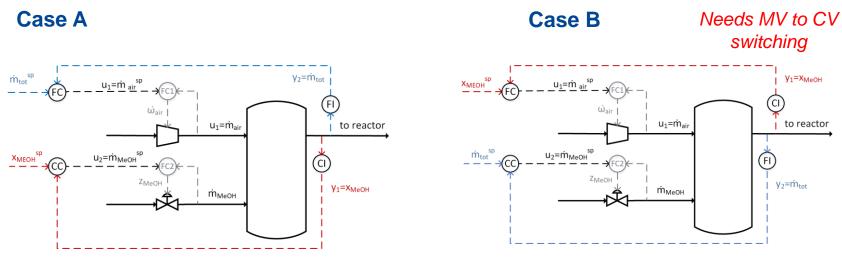

Following input saturation pairing rule

NOT following input saturation pairing rule

Step A4: Design control structure for optimal operation

Following input saturation pairing rule

NOT following input saturation pairing rule

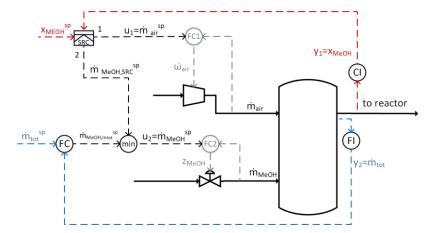

Step A5: Design control structure to handle active constraint switches

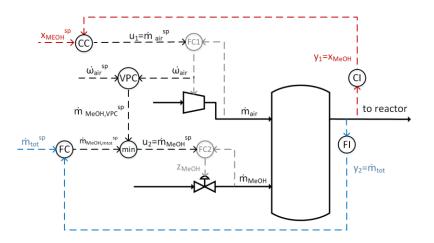

Step A5: Design control structure to handle active constraint switches

Case B-SRC Split range control+selector

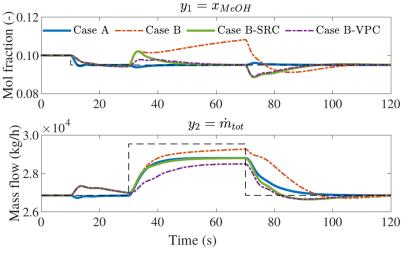

### **Case B-VPC** Valve position control + selector

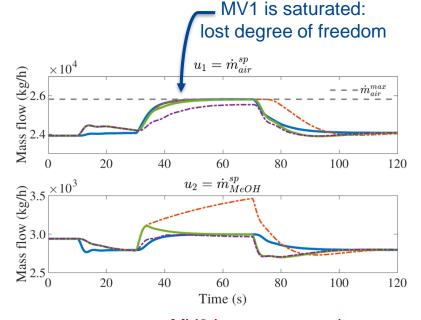

Case study: Mixing of air and MeOH

#### **High** priority CV: concentration

Low priority CV (throughput)

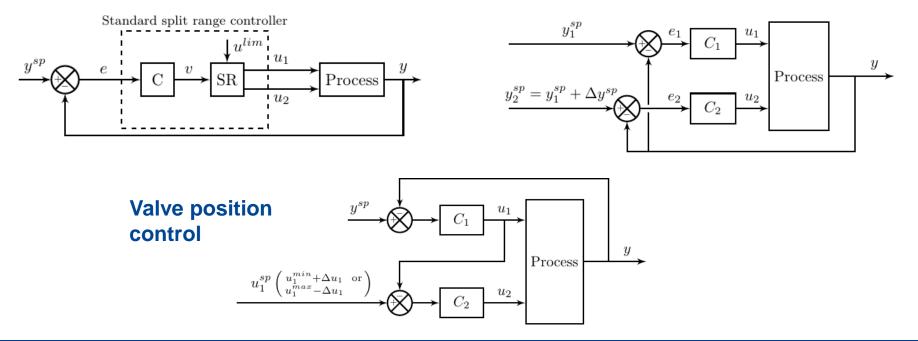

MV2 is not saturated: It should be used to control the high priority CV

# **MV to MV constraint switching**

### Split range control

# Different controllers with different setpoints

Internal signal to split range block (v)

Internal signal to split range block (v)

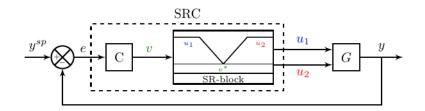

- internal signal to split range block  $\rightarrow$  limited physical meaning
- v\* split value

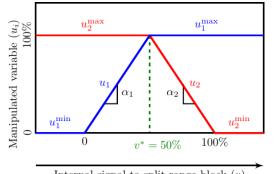

V

- $u_i$  controller output  $\rightarrow$  physical meaning
- $\alpha_i$  gain from v to ui  $\rightarrow$  slope

V

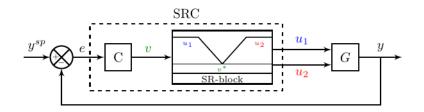

Internal signal to split range block (v)

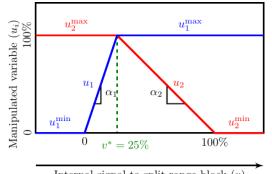

- internal signal to split range block  $\rightarrow$  limited physical meaning
- $v^*$  split value  $\rightarrow$  degree of freedom
- $u_i$  controller output  $\rightarrow$  physical meaning
- $\alpha_i$  gain from v to ui  $\rightarrow$  slope

$$u_i = u_{i,0} + \alpha_i \ v \ \forall i \in \{1, \dots, N\}$$

V

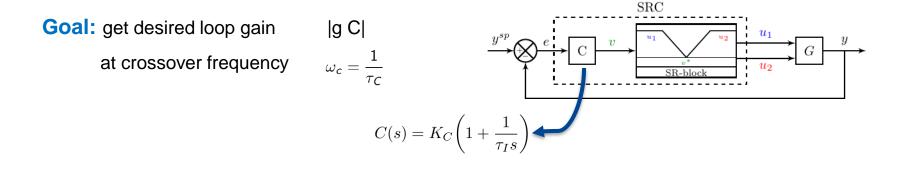

Internal signal to split range block (v)

- internal signal to split range block  $\rightarrow$  limited physical meaning
- $v^*$  split value  $\rightarrow$  degree of freedom
- $u_i$  controller output  $\rightarrow$  physical meaning
- $\alpha_i$  gain from v to ui  $\rightarrow$  slope

$$u_i = u_{i,0} + \alpha_i \ v \ \forall i \in \{1, \dots, N\}$$

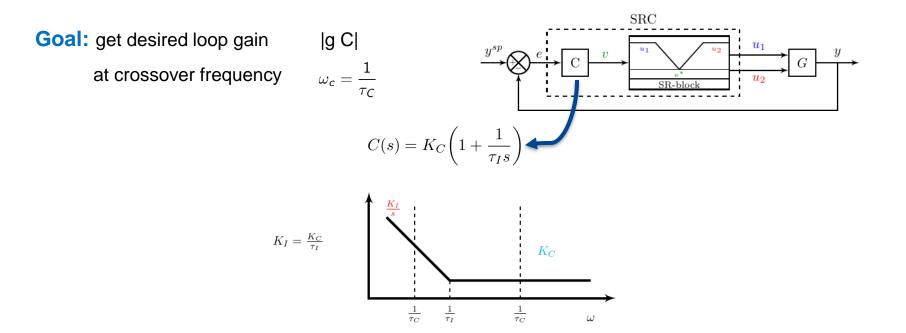

## Design of split range control: select slopes

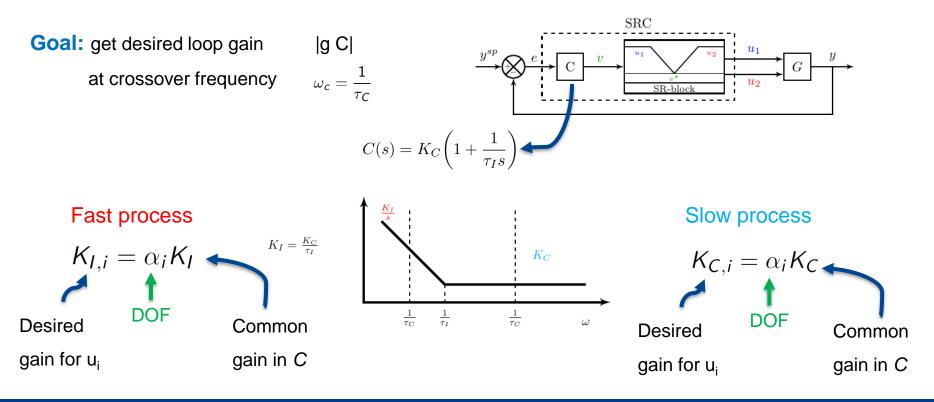

## Design of split range control: select slopes

## Design of split range control: select slopes

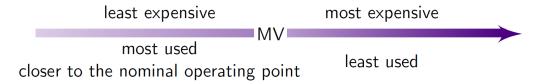

# **Design of split range control: order of MVs**

Define the desired operating point for every MV

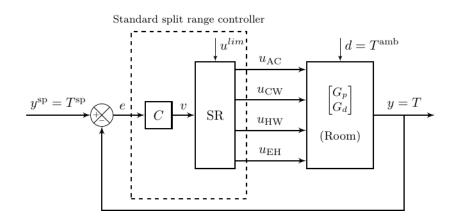

Group the MVs according to the effect on the CV

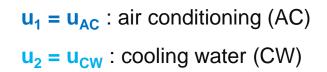

Within each group, define order of use

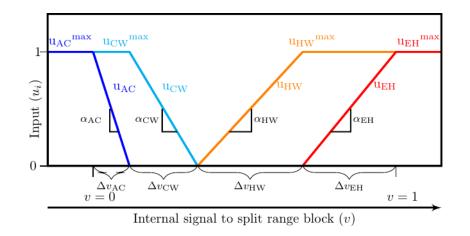

## **Design of split range control**

 $u_3 = u_{HW}$ : heating water (HW)  $u_4 = u_{EH}$ : electrical heating (EH)

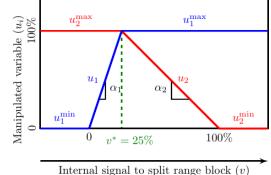

## **Classical split range control: a compromise**

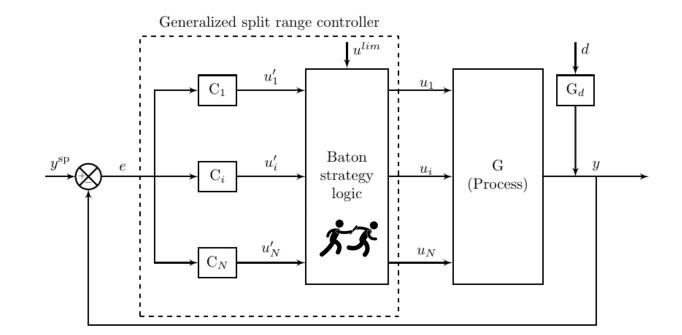

$$C(s) = K_C \left( 1 + \frac{1}{\tau_I s} \right)$$
2 tuning parameters

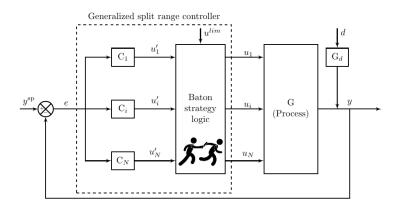

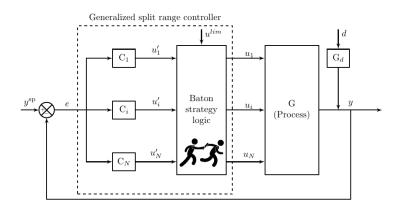

#### **Preliminary step:**

- Define order of use of MVs ( j=1,...,N)
- Tune controllers

#### **Preliminary step:**

- Define order of use of MVs ( j=1,...,N)
- Tune controllers

#### «Baton strategy» logic

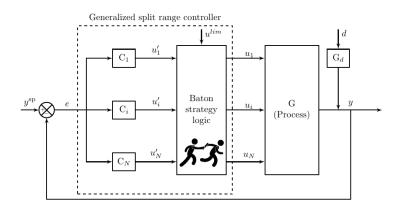

#### k is the active input

- $C_k$  computes  $u_k$ ' (suggested value for  $u_k$ )
- If  $u_k^{min} < u_k^{\prime} < u_k^{max}$ 
  - Keep  $u_k$  active and  $u_k \leftarrow u_k$ '
  - Keep remaining u<sub>i</sub> at limiting value
- else

•

- Set  $u_k = u_k^{min}$  or  $u_k < u_k^{max}$ , depending on the reached limit
- New active input selected according to predefined sequence
   (*j*= *k*-1 or *j*=*k*+1)

#### **Preliminary step:**

- Define order of use of MVs ( *j*=1,...,N)
- Tune controllers

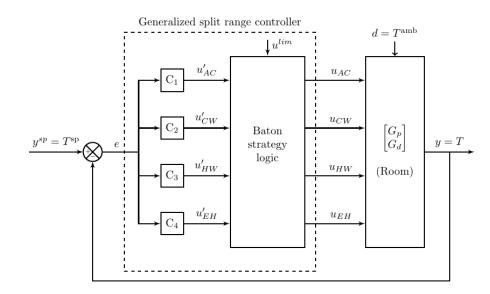

#### «Baton strategy» logic

#### k is the active input

- $C_k$  computes  $u_k$ ' (suggested value for  $u_k$ )
- If  $u_k^{min} < u_k^{i} < u_k^{max}$ 
  - Keep  $u_k$  active and  $u_k \leftarrow u_k$
  - Keep remaining u<sub>i</sub> at limiting value
- else
  - Set  $u_k = u_k^{min}$  or  $u_k < u_k^{max}$ , depending on the reached limit
  - New active input selected according to predefined sequence
     (*j*= *k*-1 or *j*=*k*+1)

The active input will *decide* when to switch and will remain active as long as it is not saturated.

 $u_1 = u_{AC}$ : air conditioning (AC)  $u_2 = u_{CW}$ : cooling water (CW)

	Active input (input with <i>baton</i> , $u_k$ )			
Value of $u_k^\prime$	$u_1 = u_{\rm AC}$	$u_2 = u_{\rm CW}$	$u_3 = u_{\rm HW}$	$u_4 = u_{\rm EH}$
$u_k^{min} < u_k^\prime < u_k^{max}$	keep $u_1$ active $u_1 \leftarrow u'_1$	keep $u_2$ active $u_1 \leftarrow u_1^{min}$	keep $u_3$ active $u_1 \leftarrow u_1^{min}$	keep $u_4$ active $u_1 \leftarrow u_2^{min}$
	$u_2 \leftarrow u_2^{max}$	$u_2 \leftarrow u'_2$	$u_2 \leftarrow u_2^{min}$	$u_2 \leftarrow u_1^{\min}$
	$\begin{array}{l} u_3 \leftarrow u_3^{min} \\ u_4 \leftarrow u_4^{min} \end{array}$	$\begin{array}{l} u_3 \leftarrow u_3^{min} \\ u_4 \leftarrow u_4^{min} \end{array}$	$u_3 \leftarrow u_3' \ u_4 \leftarrow u_4^{min}$	$u_3 \leftarrow u_3^{max} \\ u_4 \leftarrow u_4'$
$u_k' \geq u_k^{max}$	keep $u_1$ active (max. cooling)	baton to $u_1$ $u_1^0 = u_1^{min}$	baton to $u_4$ $u_4^0 = u_4^{min}$	keep $u_4$ active (max. heating)
$u_k' \leq u_k^{min}$	baton to $u_2$ $u_2^0 = u_2^{max}$	baton to $u_3$ $u_3^0 = u_3^{min}$	baton to $u_2$ $u_2^0 = u_2^{min}$	baton to $u_3$ $u_3^0 = u_3^{max}$
		5 5		0

 $u_3 = u_{HW}$ : heating water (HW)  $u_4 = u_{EH}$ : electrical heating (EH)

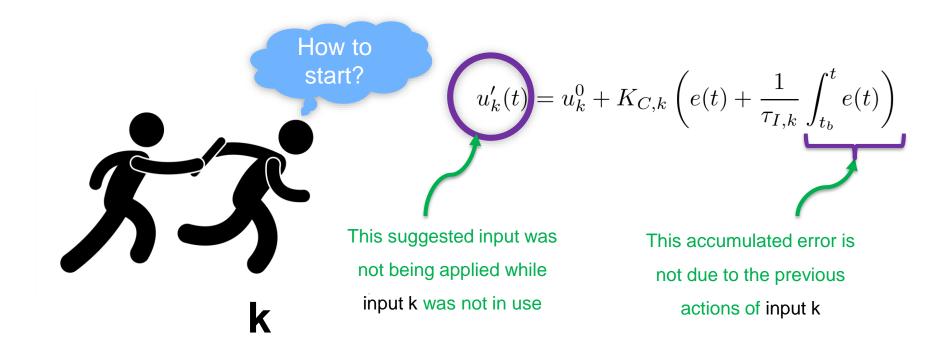

## **Generalized vs standard split range controller**

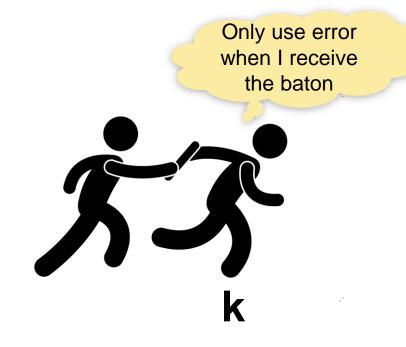

**Resetting:** 

$$u_{k}'(t) = u_{k}^{0} + K_{C,k} \left( e(t) + \frac{1}{\tau_{I,k}} \int_{t_{b}}^{t} e(t) \right)$$

 $u_k(t_b) = u_k^0 + K_{C,k}e(t_b)$ 

Initial action proportional to error at t<sub>b</sub>

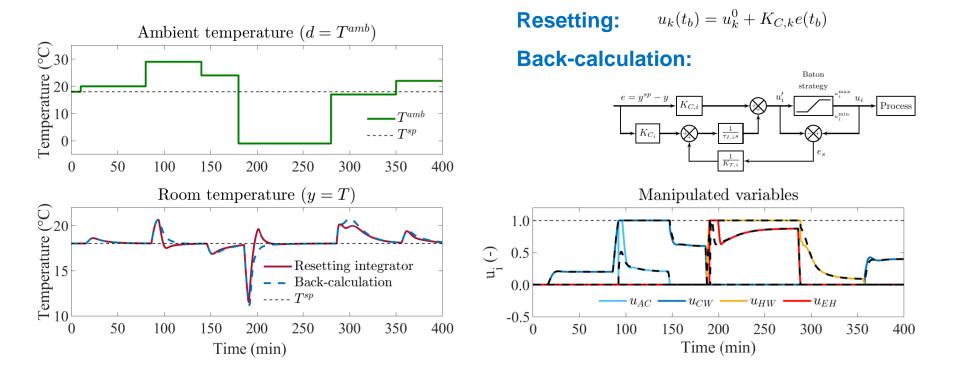

I was keeping track of the applied input

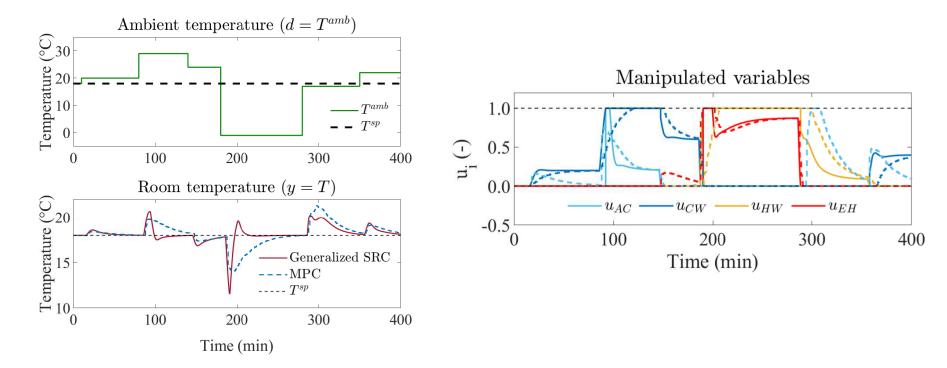

**Back-calculation:** 

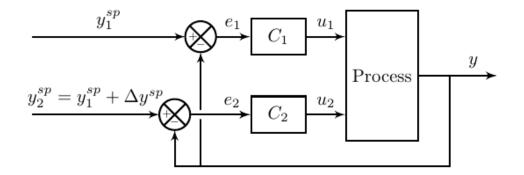

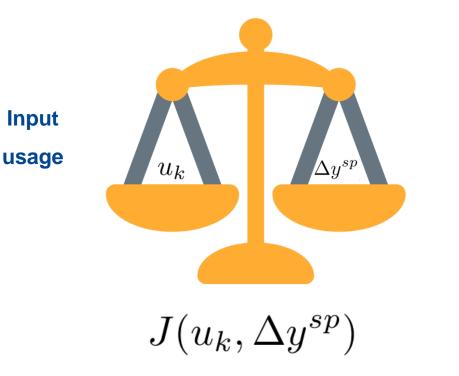

#### Does this make sense at any point?

Setpoint deviation

## Multiple controllers with different setpoints: Optimal setpoint deviation

Linear for u and quadratic for  $\Delta y$ 

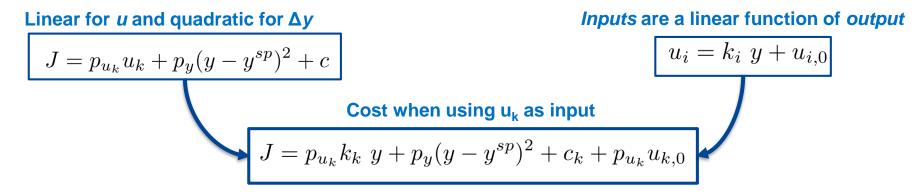

$$J = p_{u_k} u_k + p_y (y - y^{sp})^2 + c$$

Inputs are a linear function of output

$$u_i = k_i \ y + u_{i,0}$$

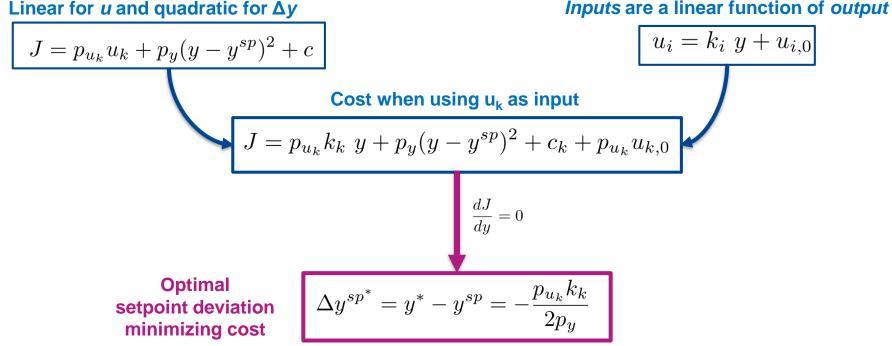

### Multiple controllers with different setpoints: Optimal setpoint deviation

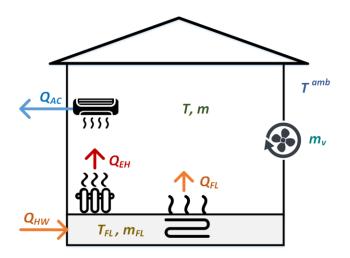

### Multiple controllers with different setpoints: **Optimal setpoint deviation**

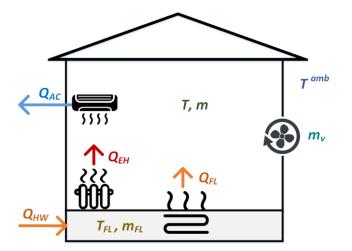

### Multiple controllers with different setpoints: Case study

- Q<sub>AC</sub> : air conditioning Q<sub>HW</sub> : heating water
- **Q<sub>EH</sub>** : electrical heating

## Multiple controllers with different setpoints: Case study

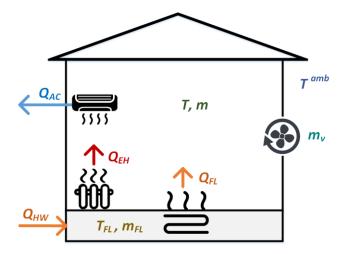

#### Cost: linear for u and quadratic for $\Delta y$

- Q<sub>AC</sub> : air conditioning Q<sub>HW</sub> : heating water
- **Q<sub>EH</sub>** : electrical heating

## Multiple controllers with different setpoints: Case study

- Q<sub>AC</sub> : air conditioning Q<sub>HW</sub> : heating water
- **Q**<sub>EH</sub> : electrical heating

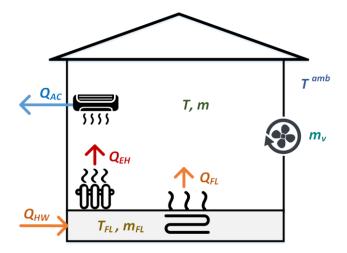

#### Cost: linear for u and quadratic for $\Delta y$

$$J = \underbrace{p_{AC}Q_{AC}}_{p_1u_1} + \underbrace{p_{HW}Q_{HW}}_{p_2u_2} + \underbrace{p_{EH}Q_{EH}}_{p_3u_3} + \underbrace{p_T(T - T^{sp})^2}_{p_y(y - y^{sp})^2} \quad [\$/s]$$

#### Inputs (Q<sub>i</sub>) are a linear function of output (T)

$$0 = \alpha (T^{amb} - T) + Q_{HW} + Q_{EH} - Q_{AC} \ [W]$$

Q<sub>AC</sub> : air conditioning Q<sub>HW</sub> : heating water

**Q<sub>EH</sub>** : electrical heating

Cost: linear for u and quadratic for  $\Delta y$ 

$$J = \underbrace{\underbrace{p_{AC}Q_{AC}}_{p_1u_1} + \underbrace{p_{HW}Q_{HW}}_{p_2u_2} + \underbrace{p_{EH}Q_{EH}}_{p_3u_3} + \underbrace{p_T(T - T^{sp})^2}_{p_y(y - y^{sp})^2} \quad [\$/s]$$

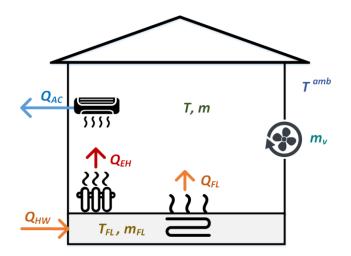

Inputs (Q<sub>i</sub>) are a linear function of output (T)

$$0 = \alpha (T^{amb} - T) + Q_{HW} + Q_{EH} - Q_{AC} \ [W]$$

#### **Optimal setpoint deviation minimizing cost**

$$\begin{split} \Delta y^{sp,1} &= T^{sp}_{AC} - T^{sp} = + \frac{\alpha p_{ac}}{2p_T} \\ \Delta y^{sp,2} &= T^{sp}_{HW} - T^{sp} = - \frac{\alpha p_{hw}}{2p_T} \\ \Delta y^{sp,3} &= T^{sp}_{EH} - T^{sp} = - \frac{\alpha p_{el}}{2p_T} \end{split}$$

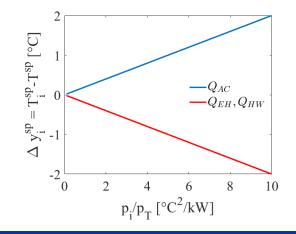

Q<sub>AC</sub> : air conditioning Q<sub>HW</sub> : heating water

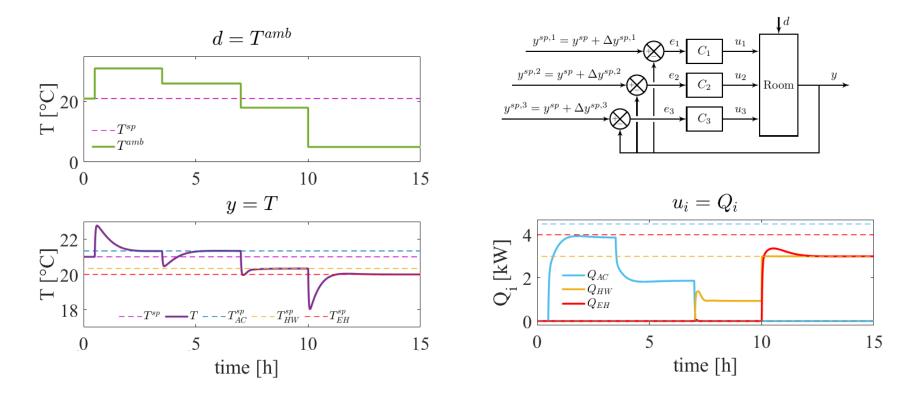

**Q<sub>EH</sub>** : electrical heating

Optimal setpoint deviation minimizing cost

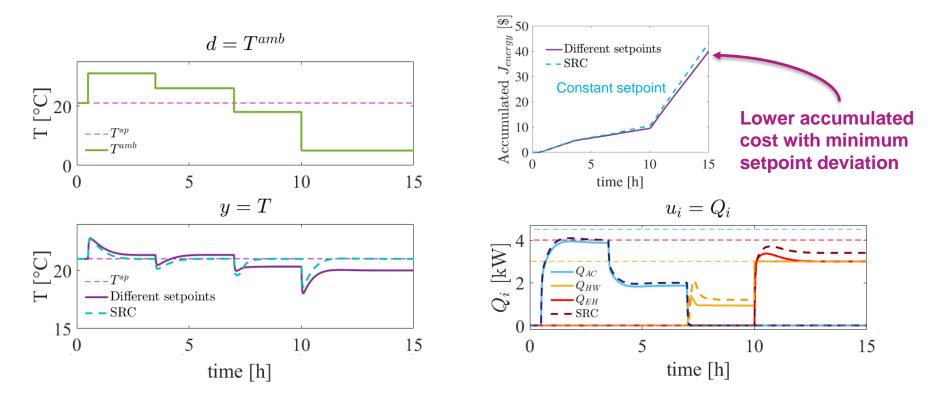

$$\Delta y^{sp,1} = T^{sp}_{AC} - T^{sp} = +\frac{\alpha p_{ac}}{2p_T}$$
$$\Delta y^{sp,2} = T^{sp}_{HW} - T^{sp} = -\frac{\alpha p_{hw}}{2p_T}$$
$$\Delta y^{sp,3} = T^{sp}_{EH} - T^{sp} = -\frac{\alpha p_{el}}{2p_T}$$

# **Final comments**

- Steady-state optimal operation may be easily achieved using PID-based control structures
  - Chapters 2,3,4: active constraint switching
  - Chapter 7: optimal setpoints

# **Final comments**

- Steady-state optimal operation may be easily achieved using PID-based control structures
  - Chapters 2,3,4: active constraint switching
  - Chapter 7: optimal setpoints
- Useful to systematically define control objectives, feasibility and tools
  - Priority list of constraints
  - Control structures available for each type of switch (CV-CV, MV-MV, MV-CV)

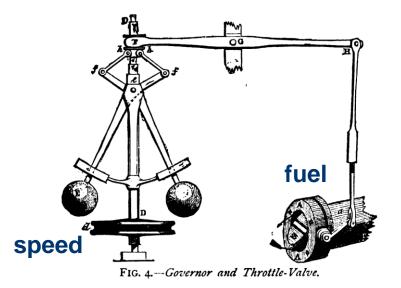

# **Final comments**

- Steady-state optimal operation may be easily achieved using PID-based control structures
  - Chapters 2,3,4: active constraint switching
  - Chapter 7: optimal setpoints
- Useful to systematically define control objectives, feasibility and tools
  - Priority list of constraints
  - Control structures available for each type of switch (CV-CV, MV-MV, MV-CV)
- Possible to improve performance of PID-based advanced control
  - Chapters 5, 6: design of split range controllers
  - Chapter 8: improved level control

# **One final comment**

• The "gap" between theory and practice can be in both directions

Centrifugal governor used in steam engines in the 1780's: Proportionally controls fuel flow to maintain engine speed.

Theoretical investigation started about a century later.

Åström, K. J., & Kumar, P. R. (2014). Control: A perspective. Automatica, 50(1), 3–43.
